General error messages

This page helps you identify the page you reached and match an error type with its message.

If you need to...	Go to
Recognize the page you reached	Recognize the error page
Match an error type to its message	Match an error message
Handle a route that does not reach its test page	When the error page cannot be reached
Get help with a wider application issue	Getting help
Work through common application problems	Common issues and solutions

Before you start

Use this page to identify the error type and read the exact message associated with its route.

Prerequisites

- Have the route name or error class in front of you.
- Use the message table to identify the error type before you continue.

Result: You know the route name or error class to use in the message table.

Recognize the error page

The error page is the page shown when the requested route cannot be found. Use its heading,

message, and error number to recognize the state before choosing what to do next.

The route path is `/test_error_view` . It displayed `Page not found` , followed by

`This page does not exist, but you can create it as you are editor of this site.` and

Error 404 .

The page displayed **Search** and **Create Page**. The page read Page not found .

Result: You can identify the page state from the route path, Page not found , the explanatory message, and Error 404 . Next, use the message table to match the error type.

Match an error message

An HTTP route returns an HTTP error response. An RPC route raises an error for an RPC request.

Use the error class and route type together when matching a message.

If you need to identify...	Select the error link in the Error type column	Message
An HTTP user error	http UserError (400)	This is a user http test
An HTTP validation error	http ValidationError (400)	This is a validation http test
An HTTP missing-record error	http MissingError (400)	This is a missing http test
An HTTP access error	http AccessError (403)	This is an access http test
An HTTP access-denied error	http AccessDenied (403)	This is an access denied http test
An HTTP internal-server error	http InternalServerError (500)	No explicit message is attached to this route.
An HTTP not-found error	http NotFound (404)	The error page displays Page not found .
An RPC user error	rpc UserError	This is a user rpc test
An RPC validation error	rpc ValidationError	This is a validation rpc test
An RPC missing-record error	rpc MissingError	This is a missing rpc test
An RPC access error	rpc AccessError	This is an access rpc test
An RPC access-denied error	rpc AccessDenied	This is an access denied rpc test

If you need to identify...	Select the error link in the Error type column	Message
An RPC internal-server error	<code>rpc InternalServerError</code>	No explicit message is attached to this route.

Result: You can match each error class with its message in the table. If the page shows

`Page not found`, continue with the route check below.

When the error page cannot be reached

Use the `http NotFound (404)` row to identify the 404 page message.

1. Select an error link in the Error type column, then use the matching row:

If the page displays...	Read...
<code>Page not found</code>	The route path and <code>Error 404</code>
Another error message	The matching message in the Message column

Result: You can identify the error page from `Page not found` and `Error 404`, or match another displayed message in the Message column. Continue to What to do next for broader help.

What to do next

Use [Getting help](#) when you need help with an application issue. Use [Common issues and solutions](#) when you need a broader troubleshooting path.

The `Website test setting` belongs to website configuration rather than this reference.

Result: You have the matching error message and the next help page for the issue.
