DocsPrTrigger

Kind: Class

Source: [atloria-monorepo/apps/api/src/docs-pr/docs-pr-trigger.ts](https://github.com/atloria-monorepo/apps/api/src/docs-pr/docs-pr-trigger.ts)

A dependency-free hop that lets the webhook request a docs-PR check WITHOUT importing

DocsPrModule — which would create a module cycle (WebhookModule ->

DocsPrModule ->

GithubAppModule -> forwardRef(WebhookModule)).

DocsPrService registers the real handler on init. If the feature module isn't loaded, `requestCheck` is a silent no-op — so wiring this into the webhook can never break it.

Methods

Method	Signature	Returns
<code>register</code>	<code>register(fn: (projectId: string) => Promise<unknown>)</code>	<code>void</code>
<code>registerPrClosed</code>	<code>registerPrClosed(fn: (repoUrl: string, prNumber: number, merged: boolean) => Promise<unknown>)</code>	<code>void</code>
<code>requestCheck</code>	<code>requestCheck(projectId: string)</code>	<code>void</code>
<code>requestPrClosed</code>	<code>requestPrClosed(repoUrl: string, prNumber: number, merged: boolean)</code>	<code>void</code>

Where it refuses work

- `DocsPrTrigger` stops the work with an early return when `!this.handler` .
- `DocsPrTrigger` stops the work with an early return when `!this.prClosedHandler` .
