RestClient

Kind: Class

Source: [atloria-monorepo/packages/api-client/src/clients/RestClient.ts](#)

REST client for making HTTP requests

Methods

Method	Signature	Returns
<code>getInterceptors</code>	<code>getInterceptors()</code>	<code>InterceptorManager</code>
<code>setToken</code>	<code>setToken(token: string)</code>	<code>void</code>
<code>getToken</code>	<code>getToken()</code>	<code>string</code>
<code>request</code>	<code>request(config: RequestConfig)</code>	<code>Promise<T></code>
<code>get</code>	<code>`get(path: string, params: Record<string, string</code>	<code>number</code>
<code>post</code>	<code>post(path: string, body: unknown, config: Partial<RequestConfig>)</code>	<code>Promise<T></code>
<code>put</code>	<code>put(path: string, body: unknown, config: Partial<RequestConfig>)</code>	<code>Promise<T></code>
<code>patch</code>	<code>patch(path: string, body: unknown, config: Partial<RequestConfig>)</code>	<code>Promise<T></code>
<code>delete</code>	<code>delete(path: string, config: Partial<RequestConfig>)</code>	<code>Promise<T></code>

Where it refuses work

- `RestClient` stops the work with `TimeoutError` when `timeoutController.signal.aborted` .
- `RestClient` stops the work with an early return when `config.skipRetry` , in 2 places.
- `RestClient` stops the work with an early return when `!response.ok` .

- `RestClient` stops the work with an early return when `'statusCode' in error` .

When something fails

- `RestClient` handles failure in 2 places: it lets it reach the caller in all 2.
