BOOSTER_WORDS

Kind: Constant

Source: atloria-monorepo/libs/parser-core/src/techdocs/booster-words.ts

The words a generated page must never contain, and the gate that keeps them out.

Measured against Google Code Wiki, one of its subsystem pages carried 118 of these in a single

document; ours carried zero across twelve. That zero is the most fragile record on the page,

because it lives entirely inside one AI-written paragraph, and a prompt asking a model politely

not to say "robust" is a hope, not a guarantee — the prompt already banned five of these and the

other six were never listed at all.

So the check is deterministic and it sits after the model, not before it. A paragraph carrying a

booster is dropped whole rather than edited: the sentence that reaches for

"comprehensive" is

usually the sentence with nothing measured to say, and a page with no responsibility paragraph

already says so honestly in its own section. Less prose is the correct outcome, not a worse one.

The list is the measured one, plus the inflections a model reaches for when a stem is banned

("efficiently" for "efficient", "ensuring" for "ensures"). It is deliberately not a general style checker: every word here is one that survives deletion, which is what makes it a booster

rather than a verb.
