## DEFAULT\_REGISTRY\_LANG

---

**Kind:** Constant

**Source:** [atloria-monorepo/apps/api/src/docs-repo/sidecar.ts](https://github.com/atloria-monorepo/apps/api/src/docs-repo/sidecar.ts)

B6 (docUuid, lang) registry keying — a PERSISTED-FORMAT MIGRATION done inside the parse

path, not a rewrite of the ledger:

- lang === 'default' → the key is the BARE docUuid — byte-identical to every entry written before B6, so an existing ledger round-trips without a single changed key (no fabricated commit, no history churn).
- any other lang → `docUuid@<lang>`. '@' is not a uuid character and not produced by any slug/scope, so the split is unambiguous; `parseRegistryKey` treats a key with no '@' as the legacy form (lang='default').
