explorerTokens

Kind: Constant

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/theme.ts`

The shadow-side half: the explorer's long-standing vocabulary, restated in terms of the mode tokens.

Deliberately NOT a place to declare `--ax-*` itself. A declaration on an element beats a value inherited into it, and the sheet cannot reach a component nested inside another component's shadow root — so a `:host { --ax-surface: ... }` here would pin every nested

panel to its own light default and quietly undo the theme one level down. Chromium says

so plainly; jsdom does not, which is what `tools/verify-explorer-theme.mjs` is for.

Each alias therefore ends in the value that declaration always had, so a page with no sheet installed — and every `var(--ax-..., #hex)` through the component styles — still renders exactly as it did before this file existed.
