GLOBAL_THROTTLE

Kind: Constant

Source: [atloria-monorepo/apps/api/src/common/throttling.module.ts](https://github.com/atloria-monorepo/apps/api/src/common/throttling.module.ts)

Global rate-limiting configuration.

- GLOBAL_THROTTLE: sane per-IP default applied to every HTTP route.
- AUTH_LOGIN_THROTTLE: strict limit on credential endpoints to slow brute-force attacks.
- PUBLIC_SSE_THROTTLE: strict per-IP quota on the public, unauthenticated SSE LLM endpoint (each request costs real AI tokens).
- PLAYGROUND_PROXY_THROTTLE: per-IP quota on the public try-it proxy — it fetches the project's declared API hosts on behalf of anonymous visitors.

Values are exported so specs can assert the exact quotas the guard enforces on real routes.
