NOTION_MAX_CHILDREN

Kind: Constant

Source: [atloria-monorepo/apps/api/src/technical-docs/md-to-notion-blocks.ts](https://github.com/atloria-monorepo/apps/api/src/technical-docs/md-to-notion-blocks.ts)

Dependency-free markdown → Notion block objects (the `children` payload for the Notion API).

Parallels `mdToStorageHtml` (Confluence): covers exactly what our generated pages emit —

headings, paragraphs with inline formatting, fenced code, bulleted lists; tables degrade to

paragraphs. No `@notionhq/client` (ESM-only → would break the CJS server build, like `marked`).

Two hard Notion limits are baked in here so the export never 400s:

- a single rich-text run's `content` must be ≤ 2000 chars → long runs are split.
- a request may carry ≤ 100 child blocks → chunking is done by the caller (see `NOTION_MAX_CHILDREN`).
