VIDEO_EXT_RE

Kind: Constant

Source: [atloria-monorepo/apps/web/src/components/Viewer/remarkDirectiveComponents.ts](https://github.com/atloria-monorepo/apps/web/src/components/Viewer/remarkDirectiveComponents.ts)

remarkDirectiveComponents — the reader-side directive pipeline (B3/B4).

Generalizes the old inline `remarkAdmonitions` plugin: every directive name gets an explicit branch that tags the node with `data.hProperties` markers (the same mechanism admonitions/ `:::video` already used), and `CustomDiv` in `MarkdownRenderer` dispatches on the class names. Runs AFTER `remark-directive` and never emits raw HTML, so it is safe under `rehypeRaw`.

Handled directives:

- `:::video` → chaptered player / safe embed (moved verbatim from `MarkdownRenderer`)
- `:::tabs` + `:::tab-panel{label}` → `.tabs-block` with `.tab-panel-block` groups (interactive)
- `:::steps` → `.steps-block` (pure CSS step counters)
- `:::cards` + `:::card{title icon href}` → `.cards-block` / `.card-block` grid (pure CSS)
- `:::code-group` → `.code-group-block` with labels derived from fence meta (interactive)
- `:::include{snippet}` → `.snippet-include-block` graceful placeholder (content is normally expanded server-side before it ever reaches the renderer)
- anything else → the classic `admonition admonition-{name}` div
