applyAuthoredDocs

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts)

Write recovered docs onto an endpoint entity, in the shape the spec builder reads.

`entity.description` keeps carrying the summary because that is what it has always meant

downstream (`summary: entity.description ?? entity.name`); `metadata.summary` and `metadata.description` are the new, explicit channel. Existing values are never clobbered

—
a parser that already resolved something better keeps it.

Signature

```
function applyAuthoredDocs(endpoint: DocumentableEndpoint, docs: AuthoredDocs): void
```

Parameters

Name	Type
<code>endpoint</code>	<code>DocumentableEndpoint</code>
<code>docs</code>	<code>AuthoredDocs</code>

Returns: `void`
