classifyResponse

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/response-shape.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/response-shape.ts)

Classify a handler's response from its source, or return undefined to leave it alone.

`source` should be the decorators plus the signature plus the body — everything the parser can

see about one handler. `returnType` and `routePath` sharpen the answer where the body is ambiguous.

Signature

```
function classifyResponse(source: string, returnType: string, routePath: string): ResponseShape
```

Parameters

Name	Type
<code>source</code>	<code>string</code>
<code>returnType</code>	<code>string</code>
<code>routePath</code>	<code>string</code>

Returns: `ResponseShape` | `undefined`
