createPkcePair

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/oauth2.ts`

A PKCE verifier and its S256 challenge.

Refuses rather than falling back to `plain` when SubtleCrypto is unavailable — which in practice means an insecure context. `plain` sends the verifier in the authorization request, so it protects against nothing; a flow that cannot be run safely should not be run.

Signature

```
async function createPkcePair(crypto: CryptoLike): Promise<PkcePair>
```

Parameters

Name	Type
<code>crypto</code>	<code>CryptoLike</code>

Returns: `Promise<PkcePair>`
