createProjectForDir

Kind: Function

Source: `atloria-monorepo/libs/parser-core/src/openapi/schema-resolver.ts`

Build a ts-morph Project for a repo dir. Uses the nearest tsconfig for compiler options (type resolution fidelity) but ALWAYS adds source files by glob — solution-style tsconfigs

(`include: []` + project references, as Nx apps use) would otherwise load zero files.

Signature

```
function createProjectForDir(rootDir: string): Project
```

Parameters

Name	Type
<code>rootDir</code>	<code>string</code>

Returns: `Project`
