declareMissingPathParams

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/path-parameters.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/path-parameters.ts)

Last resort: declare any path template expression the assembled spec still leaves undeclared.

Runs over the finished spec rather than inside a parser precisely because it must not depend

on which parser produced the operation — an OpenAPI file with a thin `paths` block, a framework we add next year, or a cross-file pass that rewrote a path and forgot its parameters all land here. Names are taken verbatim from the published path, because a parameter whose name differs from the token by so much as a sigil leaves the operation just as uncallable as it was.

Returns how many it had to invent, which is the number to watch: every one of them is a parser that should have known better.

Signature

```
function declareMissingPathParams(spec: OpenApiLike): number
```

Parameters

Name	Type
<code>spec</code>	<code>OpenApiLike</code>

Returns: number
