decodePermalink

Kind: Function

Source: `atlوريا-monorepo/packages/ui-core/src/components/api-explorer/permalink.ts`

Read a fragment back, or null when it is not one of ours.

Never throws: a hash is attacker-supplied text, it can be a leftover from another page, and a malformed one must leave the playground working exactly as it would with no hash at all.

Signature

```
function decodePermalink(hash: string): PermalinkState | null
```

Parameters

Name	Type
hash	string

Returns: `PermalinkState | null`
