detectAiAgent

Kind: Function

Source: [atloria-monorepo/apps/api/src/events/agent-detect.ts](https://github.com/atloria-monorepo/apps/api/src/events/agent-detect.ts)

Classify a User-Agent for agent-read recording.

- Known AI bot → its normalized vendor name.
- Empty / scripted UA → 'Other bot' (record it — it's not a human).
- Real browser → null (don't record; that's page-view analytics).
- Anything else unknown → 'Other bot' (better to log than to lose the signal).

Signature

```
function detectAiAgent(userAgent: string | null): string | null
```

Parameters

Name	Type
userAgent	`string

Returns: `string | null`
