detectDjangoUpload

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/multipart.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/multipart.ts)

Django / DRF: `request.FILES`, `FileField` / `ImageField`, and the multipart parser classes.

`serializerFields` carries the view's serializer/form body when one was resolved, so the declared upload fields name themselves. A view that only declares `MultiPartParser` is still

multipart — with no field name to state, it publishes as an any-field body.

Signature

```
function detectDjangoUpload(view: string, serializerFields): MultipartBody | undefined
```

Parameters

Name	Type
<code>view</code>	<code>string</code>
<code>serializerFields</code>	<code>any</code>

Returns: `MultipartBody | undefined`
