detectNamingSchemas

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/naming-schemas.ts

The naming conventions a corpus actually follows, most populous first.

`total` is the population the share cap is measured against — pass the full entity count so a convention is judged against the whole codebase and not against the slice being rendered.

Signature

```
function detectNamingSchemas(entities: Entity[], total): NamingSchema[]
```

Parameters

Name	Type
<code>entities</code>	<code>Entity[]</code>
<code>total</code>	<code>any</code>

Returns: `NamingSchema[]`
