detectNestUpload

Kind: Function

Source: `atloria-monorepo/libs/parser-core/src/openapi/multipart.ts`

NestJS: `@UseInterceptors(FileInterceptor('avatar'))` and friends.

The interceptor argument is the multipart FIELD NAME — get that wrong and the picker uploads

under a name the server discards. `classDecorators` are consulted only when the handler also

declares an `@UploadedFile(s)` parameter: a controller-level interceptor applies to every route in the class, and reading it unconditionally would turn a whole controller multipart.

Signature

```
function detectNestUpload(methodDecorators: string, params: string, classDecorators): Multipart
```

Parameters

Name	Type
<code>methodDecorators</code>	<code>string</code>
<code>params</code>	<code>string</code>
<code>classDecorators</code>	<code>any</code>

Returns: `MultipartBody` | `undefined`
