encodeBinaryBody

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/multipart.ts`

A raw-bytes body for the same envelope. `application/octet-stream` sends the file ITSELF, not

a form, so it cannot be smuggled through as a part — it needs its own field, and it hits the

same `JSON.stringify(File) === '{}'` trap if it is left as-is.

Signature

```
async function encodeBinaryBody(blob: Blob): Promise<{ base64: string; bytes: number }>
```

Parameters

Name	Type
<code>blob</code>	<code>Blob</code>

Returns: `Promise<{ base64: string; bytes: number }>`
