encodePermalink

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/permalink.ts`

The fragment for a configured request, WITHOUT the leading `#`.

Files are absent by construction: a `File` has no serializable form short of embedding the

bytes, and a link carrying a megabyte of base64 is not a link. The caller states this beside

the button rather than letting a reader discover it after sharing.

Signature

```
function encodePermalink(state: PermalinkState, secrets: string[]): string
```

Parameters

Name	Type
<code>state</code>	<code>PermalinkState</code>
<code>secrets</code>	<code>string[]</code>

Returns: `string`
