entityMethodNames

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/example-grounding.ts

Grounding check for AI-written usage examples: a code example must not call methods that

don't exist on the entity it documents. This catches the classic enrichment hallucination

(e.g. a page for `RagChatModelService` whose example calls `createChatCompletion()` — a method

that isn't on the class). Pure + conservative: it only inspects calls on variables

PROVABLY

bound to the entity, and no-ops when the entity exposes no method list to ground against.

Signature

```
function entityMethodNames(entity: Pick<Entity, 'name'> & Record<string, any>): string[]
```

Parameters

Name	Type
entity	Pick<Entity, 'name'> & Record<string, any>

Returns: `string[]`
