extractControlFlow

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/parsers/backend/control-flow.ts](https://github.com/atloria-monorepo/libs/parser-core/src/parsers/backend/control-flow.ts)

Read the guards and catches out of a class (or any node holding statements).

Only `if` statements whose branch is a single `throw` or `return` count as guards. A condition

wrapping a block of real work is control flow but not a refusal, and calling it one would put a

sentence on the page that misdescribes the code.

Signature

```
function extractControlFlow(node: ts.Node): ControlFlow
```

Parameters

Name	Type
<code>node</code>	<code>ts.Node</code>

Returns: `ControlFlow`
