extractModals

Kind: Function

Source: `atloria-monorepo/libs/parser-core/src/utils/modal-extractor.ts`

Extract all modal definitions from both code and template, deduplicating results.

This is the main entry point for modal extraction. It calls both `extractModalsFromCode` and `extractModalsFromTemplate`, then merges results by name (code-derived modals take priority for metadata).

Signature

```
function extractModals(code: string, templateContent: string | undefined, filePath: string, componentName: string, framework: 'angular')
```

Parameters

Name	Type
<code>code</code>	<code>string</code>
<code>templateContent</code>	<code>`string`</code>
<code>filePath</code>	<code>string</code>
<code>componentName</code>	<code>string</code>
<code>framework</code>	<code>`angular`</code>

Returns: `ModalDefinition[]`
