September 4, 2026

extractPhpControlFlow

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/parsers/backend/php-control-flow.ts](https://github.com/atloria-monorepo/libs/parser-core/src/parsers/backend/php-control-flow.ts)

Read the guards and catches out of a span of PHP.

`startLine` / `endLine` are 1-based and inclusive, and bound which constructs are collected — the whole file is still masked, because a heredoc or a comment opened above the span decides what the text inside it means.

Signature

```
function extractPhpControlFlow(source: string, startLine: number, endLine: number): ControlFlow
```

Parameters

Name	Type
<code>source</code>	<code>string</code>
<code>startLine</code>	<code>number</code>
<code>endLine</code>	<code>number</code>

Returns: `ControlFlow`
