findUngroundedExampleMethods

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/techdocs/example-grounding.ts](https://github.com/atloria-monorepo/libs/parser-core/src/techdocs/example-grounding.ts)

Return the method names an example calls on an instance of `entityName` that are NOT among

`knownMethods` — i.e. hallucinated APIs. Conservative to avoid dropping good examples:

- Binds the entity only via `new EntityName(` or a `<var>: EntityName` typed param/field.
- Returns `[]` when there are no known methods (nothing to ground) or no bound var (unsure).

Calls on other objects (`res.status` , `this.prisma.insert` , standard lib) are never flagged.

Signature

```
function findUngroundedExampleMethods(example: string, entityName: string, knownMethods: string
```

Parameters

Name	Type
<code>example</code>	<code>string</code>
<code>entityName</code>	<code>string</code>
<code>knownMethods</code>	<code>string[]</code>

Returns: `string[]`
