GET

Kind: Function

Source: `atloria-monorepo/apps/web/src/app/.well-known/lms.txt/route.ts`

Tenant-level agent discovery: `/.well-known/lms.txt` — a short "About Atloria" section (so agents reading Atloria's own `lms.txt` learn what Atloria IS), followed by an INDEX (not one site's content) of every published docs site's per-site `lms.txt`. On a multi-tenant single origin (many sites under `/p/`) a root content file can't represent all sites, so this is the honest, discoverable endpoint: one fetch → the list of per-site `lms.txt` / `lms-full.txt` URLs. Each site also carries its own hints (see `p/[slugId]/layout.tsx`).
