groupImageVariants

Kind: Function

Source: `atloria-monorepo/packages/doc-automation/src/v2/stages/stage-13-upload/upload.service.ts`

Group a flat `{ refPath → blobUrl }` map into `{ <desktopBlobUrl>: ImageVariantSet }`.

PURE and exported for direct unit testing. Only base images that (a) resolved to a blob URL AND (b) actually have at least one companion (tablet/mobile/crop) produce an entry — a lone desktop shot needs no picker. Crops are ordered by their N. Keyed by the desktop blob URL because that is the exact URL the rendered `<img src>` carries (minus any `#atloria-annotations=` fragment), so the reader joins without content parsing.

Signature

```
function groupImageVariants(refToUrl: Record<string, string>): Record<string, ImageVariantSet>
```

Parameters

Name	Type
<code>refToUrl</code>	<code>Record<string, string></code>

Returns: `Record<string, ImageVariantSet>`
