impactedEntities

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/techdocs/staleness.ts](https://github.com/atloria-monorepo/libs/parser-core/src/techdocs/staleness.ts)

Given the files that changed in a push, return the set of entity ids that must be regenerated: the entities DEFINED in those files, expanded to their dependents (things that reference them) up to `hops` levels via the relationship graph. This is the SCIP-style incremental fan-out — regenerate the transitive closure, not the whole repo.

Signature

```
function impactedEntities(changedFiles: string[], entities: Entity[], relationships: Relationship[])
```

Parameters

Name	Type
<code>changedFiles</code>	<code>string[]</code>
<code>entities</code>	<code>Entity[]</code>
<code>relationships</code>	<code>Relationship[]</code>
<code>opts</code>	<code>{ hops?: number }</code>

Returns: `Set<string>`
