installExplorerTheme

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/theme.ts`

Put the mode-resolving sheet in the host document, once.

It has to live in the light DOM: only there can a selector see `<html>` and read the mode off it. Everything the sheet sets is a custom property on the explorer's own elements, so nothing outside the explorer changes — and from those elements the values

inherit down through every shadow root the explorer opens.

Called from `connectedCallback`, which runs before the first render, so the very first paint is already themed.

Signature

```
function installExplorerTheme(doc: Document): void
```

Parameters

Name	Type
<code>doc</code>	<code>Document</code>

Returns: `void`
