mergeSlugRegistry

Kind: Function

Source: [atloria-monorepo/apps/api/src/docs-repo/sidecar.ts](https://github.com/atloria-monorepo/apps/api/src/docs-repo/sidecar.ts)

Merge the current served set into the existing registry and return the deterministic string.

For each page (keyed by docUuid): upsert slug/scope/lang/kgEntityId. If the slug CHANGED from the stored one, append the old slug to previousSlugs (dedup, keep order). Entries for docUuids no longer served are RETAINED — the ledger is an identity history, not a mirror of the live set (a page can be unpublished then republished under the same identity, and rename history must survive a doc dropping out of the served set for a version).

Signature

```
function mergeSlugRegistry(existingJson: string | null | undefined, pages: PageIdentity[]): str
```

Parameters

Name	Type
existingJson	`string
pages	PageIdentity[]

Returns: `string`
