normalizeGrant

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/oauth2.ts`

Turn a token response into what we keep.

RFC 6749 §5.1: an omitted `scope` means the grant matches what was requested — so the requested scopes are recorded rather than leaving the reader with a token of unknown reach.

`refresh_token` is read and DROPPED here, in one place, so no caller can accidentally persist a credential that outlives the tab.

Signature

```
function normalizeGrant(schemeId: string, raw: Record<string, unknown>, requestedScopes: string
```

Parameters

Name	Type
<code>schemeId</code>	<code>string</code>
<code>raw</code>	<code>Record<string, unknown></code>
<code>requestedScopes</code>	<code>string[]</code>
<code>now</code>	<code>any</code>

Returns: `OAuth2Grant`
