parseDocComment

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts)

Parse a `@tag` -style doc comment — JSDoc, Javadoc, PHPDoc, KDoc, or a swaggo `//` run.

`raw` may still carry its comment syntax; pass the `style` it was written in.

Free text before the first tag is the summary/description. Tags are read for the four things

a spec can carry: explicit summary/description overrides, per-parameter prose, and the

return/success prose that becomes the 200 description.

Signature

```
function parseDocComment(raw: string, style: CommentStyle): AuthoredDocs
```

Parameters

Name	Type
<code>raw</code>	<code>string</code>
<code>style</code>	<code>CommentStyle</code>

Returns: `AuthoredDocs`
