parseDocsPath

Kind: Function

Source: [atlوريا-monorepo/apps/api/src/git-sync/git-sync.types.ts](#)

Parse `docs/<scope>/<lang>/<slug>.md` into its identity parts. Null for anything that doesn't match the exact 3-segment shape with a KNOWN audience scope — the substrate never serves any other layout, so an unparseable path can never become a createPath.

Signature

```
function parseDocsPath(substratePath: string): DocsPathParts | null
```

Parameters

Name	Type
substratePath	string

Returns: `DocsPathParts | null`
