

parseSlugRegistry

September 4, 2026

parseSlugRegistry

Kind: Function

Source: `atloria-monorepo/apps/api/src/docs-repo/sidecar.ts`

Parse an existing registry file; tolerate absent/corrupt input by starting empty.

"Corrupt"

covers BOTH syntactic (bad JSON) AND structural (valid JSON, wrong shape)

corruption: every

entry is COERCED to the expected shape so a hand-edited/partial-write/migration-renamed file

with, say, a missing `previousSlugs` can never make a later `[...entry.previousSlugs]` throw

and wedge the committer on every reconcile. A malformed entry is repaired, not trusted.

Signature

```
function parseSlugRegistry(json: string | null | undefined): SlugRegistry
```

Parameters

Name	Type
<code>json</code>	<code>`string</code>

Returns: `SlugRegistry`
