parseXmlDocComment

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts](https://github.com/atloria-monorepo/libs/parser-core/src/openapi/doc-annotations.ts)

Parse a .NET XML documentation comment.

`<summary>` and `<remarks>` map cleanly onto the two spec fields: the summary is the one-line

contract and remarks is where .NET authors put the long form. When there is no

`<summary>`

element at all the comment is plain prose in `///` lines, which older code does constantly,

so it falls back to reading the text as-is rather than returning nothing.

Signature

```
function parseXmlDocComment(raw: string): AuthoredDocs
```

Parameters

Name	Type
<code>raw</code>	<code>string</code>

Returns: `AuthoredDocs`
