queryMatchesPage

Kind: Function

Source: [atloria-monorepo/apps/api/src/manuals-insights/manuals-insights.service.ts](https://github.com/atloria-monorepo/apps/api/src/manuals-insights/manuals-insights.service.ts)

Does a support query "resemble" a manual page? True when any meaningful query term

appears in the page's title or slug (fuzzy, term-overlap). Used both ways:

- weakPages: a miss that DOES resolve to a page → that page is under-serving.
- topicGaps: a miss that resolves to NO page → the topic is undocumented.

Signature

```
function queryMatchesPage(query: string, page: { title: string; slug: string }): boolean
```

Parameters

Name	Type
query	string
page	{ title: string; slug: string }

Returns: boolean
