readBodyShape

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/multipart.ts`

Read the request body of an operation.

`multipart/form-data` OUTRANKS `application/json` when an operation offers both: the JSON

branch already works and the multipart one is the one that silently produced nothing, so the

reader is put in front of the controls that can actually satisfy the upload.

Signature

```
function readBodyShape(requestBody: unknown, schemas: Record<string, unknown>): BodyShape
```

Parameters

Name	Type
<code>requestBody</code>	<code>unknown</code>
<code>schemas</code>	<code>Record<string, unknown></code>

Returns: `BodyShape`
