renderComposition

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/subsystem-narrative.ts

What the subsystem is made of, and where a reader who has to pick a file should pick.

The type mix is the one thing a directory listing cannot show and a reader always wants: a folder of 200 interfaces and a folder of 200 services are not the same kind of place.

Signature

```
function renderComposition(evidence: SubsystemEvidence | undefined, entityCount: number, subsys
```

Parameters

Name	Type
evidence	`SubsystemEvidence
entityCount	number
subsystemPath	string

Returns: string
