renderEntityControlFlow

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/control-flow-render.ts

The control-flow sections for a single entity's own page.

Returns "" when the parser recorded nothing, which is the honest answer for a component that neither refuses work nor handles failure — and is very common. A page that announced "no branches found" on every such component would turn a true absence into noise.

Signature

```
function renderEntityControlFlow(entity: { name?: string }, flow: ControlFlow): string
```

Parameters

Name	Type
entity	{ name?: string }
flow	ControlFlow

Returns: string
