renderSubsystemBoundary

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/subsystems.ts

A subsystem's boundary, stated the way the good documents state it: what it is responsible

for, and — equally — what it explicitly is not.

Returns "" when the graph cannot support the claim. A boundary asserted from dangling edges

would be confident and wrong, which is the failure mode worth avoiding above all others.

Signature

```
function renderSubsystemBoundary(subsystem: Subsystem, all: Subsystem[]): string
```

Parameters

Name	Type
subsystem	Subsystem
all	Subsystem[]

Returns: string
