resolveDjangoSerializers

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts

Fill in a DRF ModelSerializer's fields from the model it names.

```
class OutputSerializer(ModelSerializer):  
    class Meta:  
        model = BaseUser  
        fields = ("id", ...)
```

describes a real response shape, but the field TYPES live in another file. This runs once over the whole parse, where both halves are available.

A serializer whose model is not in the parse keeps no fields and therefore never becomes a component — better than a component with invented types. Returns how many were resolved.

Signature

```
function resolveDjangoSerializers(entities: Entity[]): number
```

Parameters

Name	Type
entities	Entity[]

Returns: number
