resolveLaravelResponses

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts](https://github.com/atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts)

Document what a Laravel action returns, as the framework actually sends it.

Three facts live in three files and only mean something together: the action names a resource class (`return new ArticleResource($article)`), the resource states its keys in `toArray()` , and the columns those keys read are in `database/migrations` . On top of that sits a framework rule that is invisible in all three — a resource response is WRAPPED, so the body is `{"article": {...}}` and not `{...}` . Documenting the payload alone would describe a body no caller ever receives.

A resource whose `toArray()` is not a literal array, an action returning a class the parse never saw, an `array_merge(parent::toArray(...))` whose parent is missing: all of them end with the endpoint documenting no response rather than a partial one.

Signature

```
function resolveLaravelResponses(entities: Entity[]): number
```

Parameters

Name	Type
entities	Entity[]

Returns: number
