resolveLaravelRoutes

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts](https://github.com/atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts)

Mount Laravel route files where the application actually mounts them.

`routes/api.php` is served under `/api` by convention, and the Laravel parser applies that

so a standalone parse is usable. But the convention is only a DEFAULT: the real prefix is

stated in `RouteServiceProvider` (`Route::prefix('api/v2')->group(base_path(...))`) or, since Laravel 11, in `bootstrap/app.php` (`withRouting(apiPrefix: ...)`). Where that file is in the parse and disagrees, it wins — it is the application speaking rather than a guess about it.

Endpoints whose route file is never mounted keep the convention path rather than losing it;

an app that splits routes into files a provider loads dynamically is common, and dropping

every one of its endpoints is worse than a prefix that matches the framework default.

Signature

```
function resolveLaravelRoutes(entities: Entity[]): number
```

Parameters

Name	Type
<code>entities</code>	<code>Entity[]</code>

Returns: number
