resolveLaravelSchema

Kind: Function

Source: [atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts](https://github.com/atloria-monorepo/libs/parser-core/src/techdocs/cross-file-routes.ts)

Fold Laravel's migration history into one table shape, then apply what the model says.

A table is created once and altered many times across separate files, so the create migration alone under-reports the columns. Alterations are applied in migration filename

order — the timestamp prefix makes lexicographic order chronological, which is exactly the

order the framework runs them in.

The Eloquent model then has the last word on PRESENTATION: `$casts` states the type a

column is handed back as (a `text` column cast to `array` is an array to every caller), and

`$hidden` names columns that are never serialized — documenting `password` as a response

field is not a small error.

Signature

```
function resolveLaravelSchema(entities: Entity[]): number
```

Parameters

Name	Type
<code>entities</code>	<code>Entity[]</code>

Returns: number
