resolveOAuth2Requirement

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/oauth2.ts`

Which OAuth2 scheme — and which scopes — this operation demands.

`security` is an OR of alternatives, each an AND of schemes. We take the first alternative naming a scheme we can run, which is the one a reader would be steered towards anyway. An operation declaring no `security` of its own inherits the document default; `security: []` is explicitly public and inherits nothing.

Signature

```
function resolveOAuth2Requirement(endpointSecurity: Array<Record<string, string[]>> | undefined
```

Parameters

Name	Type
<code>endpointSecurity</code>	<code>`Array<Record<string, string[]>></code>
<code>documentSecurity</code>	<code>`Array<Record<string, string[]>></code>
<code>schemes</code>	<code>OAuth2Scheme[]</code>

Returns: `OAuth2Requirement | null`
