schemaSaysNothing

Kind: Function

Source: atloria-monorepo/libs/parser-core/src/openapi/response-origin.ts

A schema that documents nothing: absent, an array of anything, or an object whose every property is itself untyped.

The "every property is untyped" arm matters because an unresolvable `Project[]` does NOT come back as `undefined` — it comes back as `{type:'array', items:{}}`, and an inferred `{ total: any }` comes back with a property carrying no type. Both LOOK like schemas and neither says anything, so every "did we get an answer?" test has to agree on this.

Signature

```
function schemaSaysNothing(schema: Record<string, unknown> | undefined): boolean
```

Parameters

Name	Type
<code>schema</code>	<code>`Record<string, unknown></code>

Returns: `boolean`
