September 4, 2026

validateOAuth2Draft

Kind: Function

Source: [atloria-monorepo/apps/web/src/app/app/projects/\[id\]/technical-docs/components/PlaygroundOAuth2Config.tsx](https://github.com/atloria-monorepo/apps/web/src/app/app/projects/[id]/technical-docs/components/PlaygroundOAuth2Config.tsx)

The same rules the API enforces, run while the owner is still looking at the field.

Duplicated on purpose. The server is the one that decides — a browser check protects nothing —

but a rejection that arrives as a red banner after a save is a much worse way to learn that an

authorization endpoint has to be https than a message under the input as it is typed.

Signature

```
function validateOAuth2Draft(draft: OAuth2Draft): OAuth2DraftValidation
```

Parameters

Name	Type
draft	OAuth2Draft

Returns: OAuth2DraftValidation
