

writeGrant

September 4, 2026

writeGrant

Kind: Function

Source: `atloria-monorepo/packages/ui-core/src/components/api-explorer/oauth2.ts`

Grants follow the reader-key custody model (`readerKey.ts`): docs-origin localStorage, keyed per project and scheme, clearable, never a cookie. An access token expires on its own; a refresh token — which would not — is never written here because `normalizeGrant` drops it.

Signature

```
function writeGrant(storage: StorageLike | undefined, namespace: string, grant: OAuth2Grant): void
```

Parameters

Name	Type
<code>storage</code>	<code>StorageLike</code>
<code>namespace</code>	<code>string</code>
<code>grant</code>	<code>OAuth2Grant</code>

Returns: `void`
