LlmsPage

Kind: Interface

Source: atloria-monorepo/libs/parser-core/src/techdocs/llms-txt.ts

Agent-native docs layer — llms.txt + llms-full.txt generators (llmstxt.org).

`llms.txt` is a curated, link-based INDEX an LLM reads to navigate the docs: an H1 project

name, a blockquote summary, then `##` sections each holding a bullet list of

`[title](path.md): description`. A section literally named `## Optional` is lower-priority (an agent may skip it under a tight context budget) and is emitted last.

`llms-full.txt` is the entire documentation concatenated into one markdown file for a single

ingest, each page prefixed with a `<!-- source: ... -->` comment for traceability.

Both are pure functions over a generic doc shape so the CLI and the web materializer can feed

their own doc sets in.

Properties

Property	Type
<code>title</code>	<code>string</code>
<code>path</code>	<code>string</code>
<code>section</code>	<code>string</code>
<code>description</code>	<code>string</code>
